

STATION13 SHIELD

Tent Instructions - Erecting Your New Tent

Roll out tent with inner tent attached to flysheet (make sure that tent entrances are fully zipped up). With tent pole sections slotted together, slide the long tent pole through the sleeve at the head end of the tent.

Fit one end of tent pole into the metal eyelet at the base, make sure that the tent material is spread evenly along the tent pole, then pop other end of the pole into the metal eyelet on the other side - there will be some tension, so ease the pole into the eyelet carefully.

Peg down the tent at the two pegging points at the base of the pole. Now peg down the head end of the tent, before moving to the foot end of the tent and inserting the shorter pole in the sleeve at the foot end. Pull the tent taut and peg down at the base of the shorter pole. Peg out the guylines at the foot end of the tent to provide a nice taut flysheet, and finally peg out the guylines at the head end of the tent.

The pegging points can be adjusted as needs be to obtain a nice even, taut flysheet. The inner tent floor straps can also be adjusted if need be in order for the inner tent to sit correctly within the flysheet.

Upper and lower air vents can be opened/closed to suit your needs.
